SUBJECT : SE LAB 2

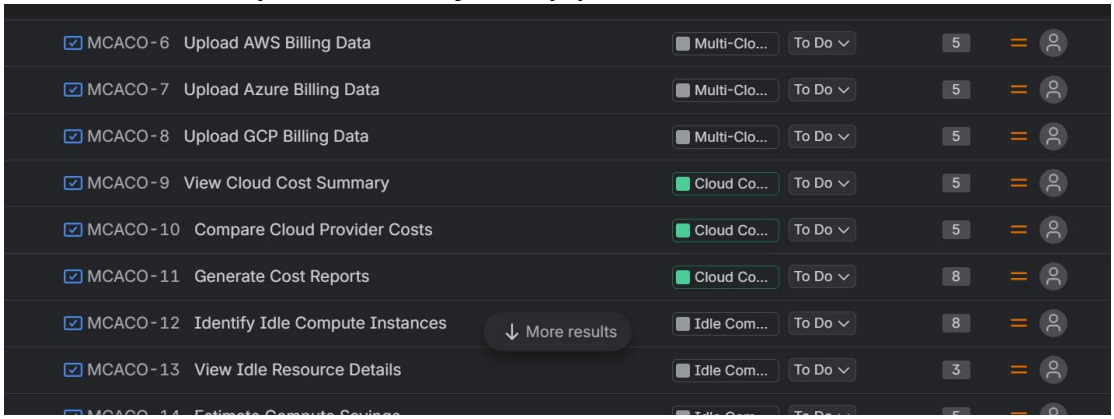

1. Jira Backlog with Epics and Stories

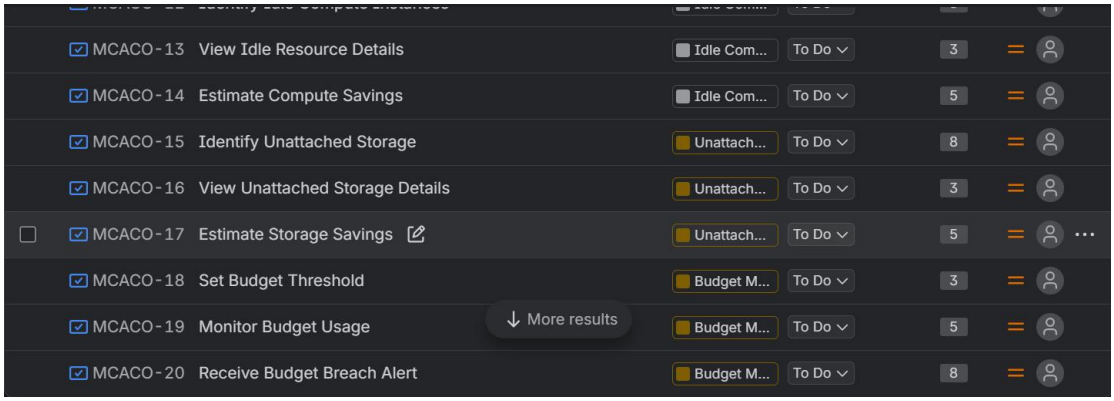

The Jira backlog shows project work items, Epic/parent links, priorities, statuses, and estimates.

2. Story Point Assignments

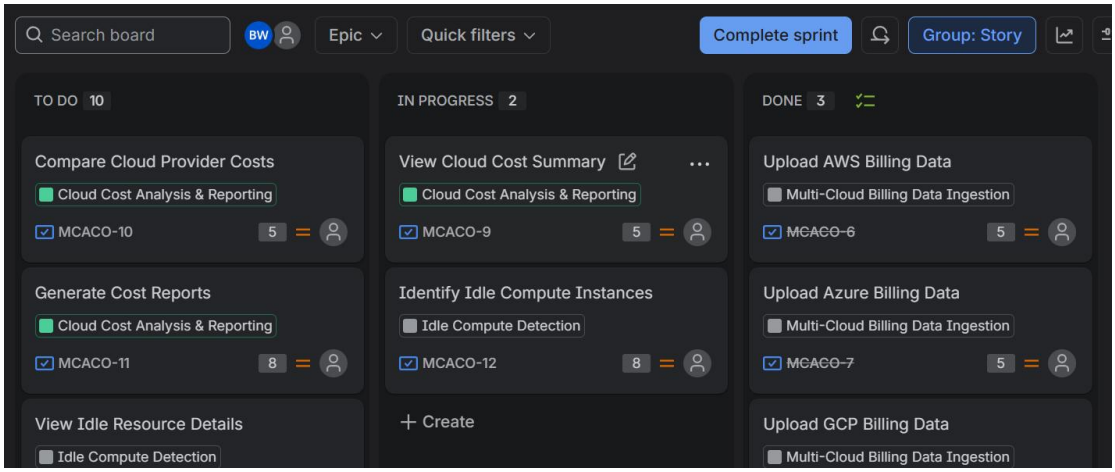

Estimates were made on a relative basis of complexity, effort and uncertainty in terms of story points.

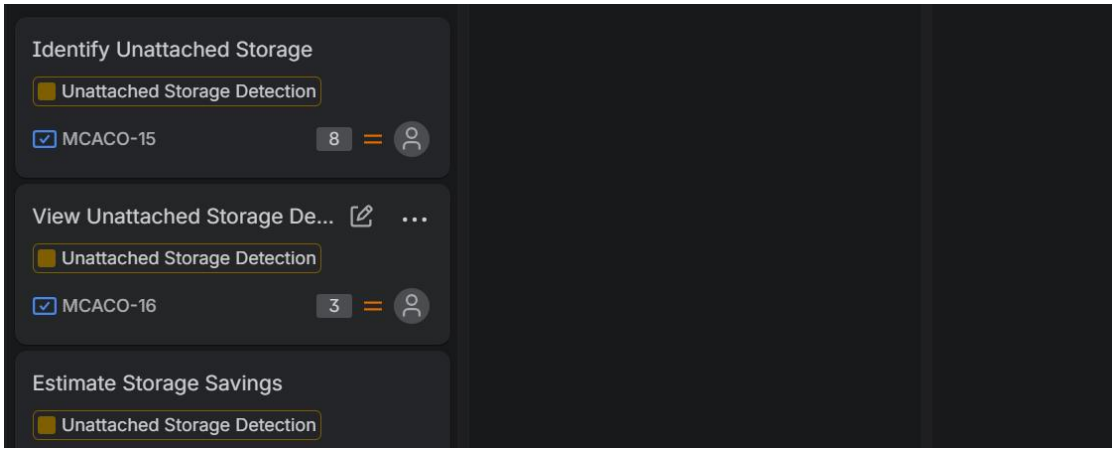

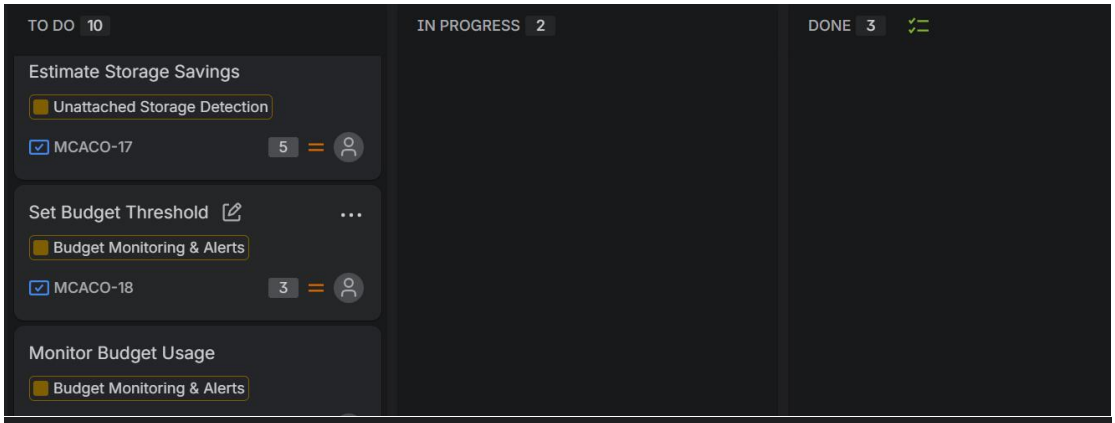

3. Sprint 1– Active Sprint

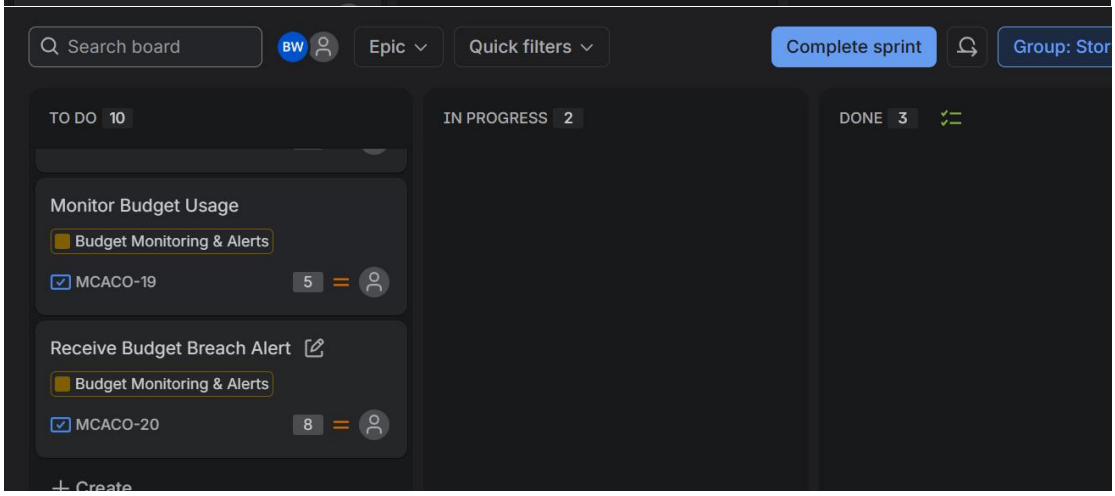

View Sprint 1 was simulated using the Jira workflow: To Do → In Progress → Done.

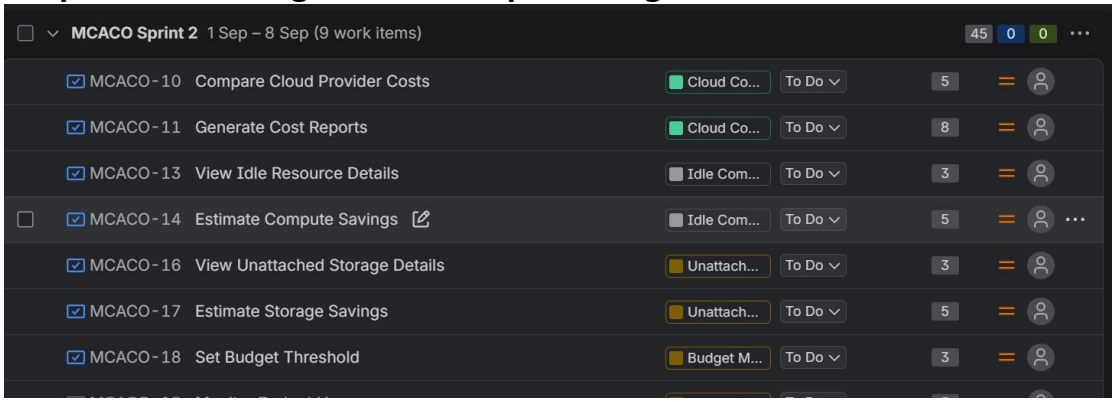

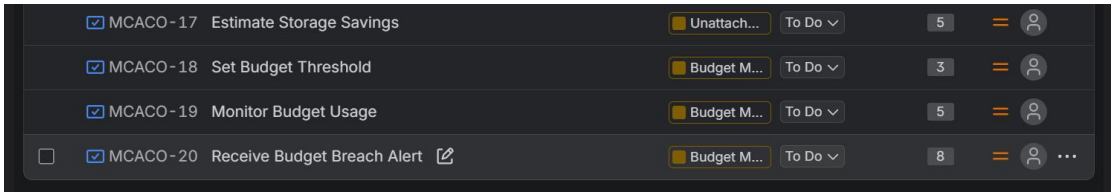

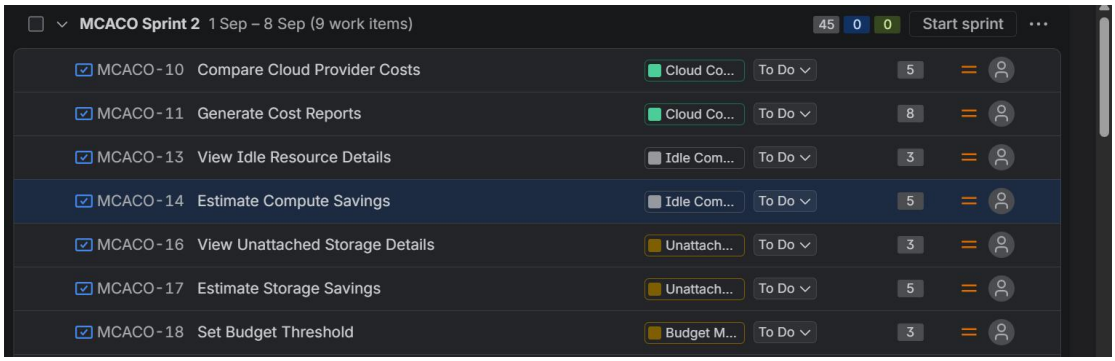

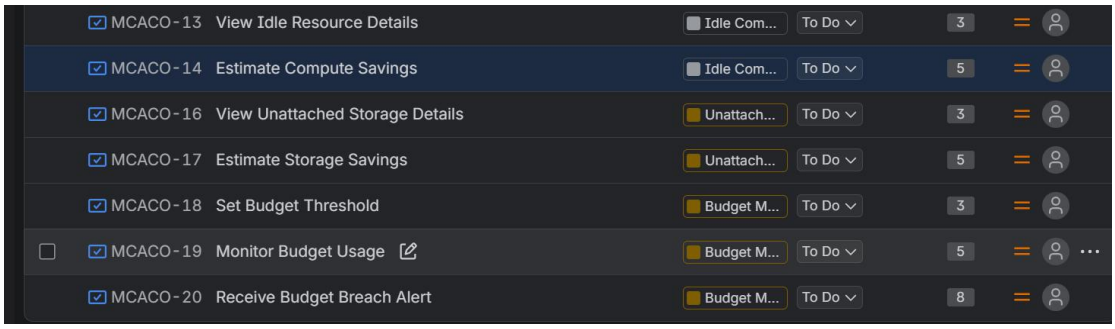

4. Sprint 2– Backlog and Active Sprint Progress

5. Sprint 2– Continued Progress

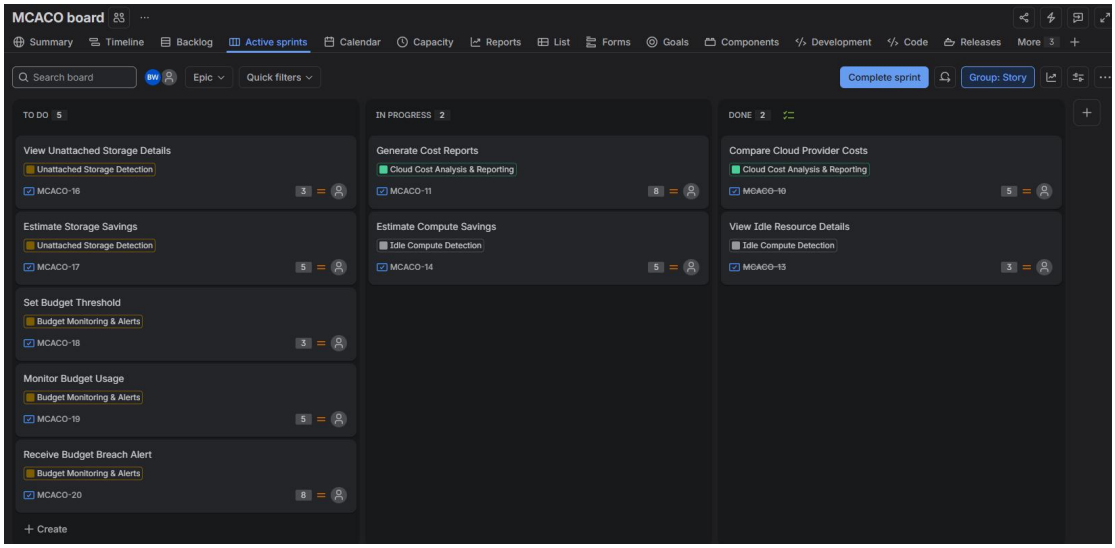

6. Burndown Charts

The burndown chart compares remaining story-point work with the ideal progress guideline.

7. Reflection Questions

1. Did your estimations reflect the actual effort?

The story point estimates were generally reasonable for the simulated sprints. The smaller and simpler stories, such as viewing resource details and setting budget thresholds, were given lower points, while stories involving billing data processing, cost analysis, resource detection, reporting, and alerts were given higher points because they involved more complexity and uncertainty. As this was a simulated sprint, the estimates provided a useful way of comparing the relative effort required for the different cloud cost optimization features.

2. Was your backlog well-prioritized?

Yes, the backlog was prioritized based on the importance of the cloud cost optimization functionality. Core features such as uploading AWS, Azure, and GCP billing data and viewing cloud cost information were considered first. These were followed by features such as identifying idle compute resources, detecting unattached storage, estimating savings, generating reports, and monitoring budgets. This helped organize the work into logical Epics and User Stories.

3. How did your simulated sprint align with your plan?

The simulated sprints generally followed the planned workflow. The User Stories moved through the Jira workflow from

To Do → In Progress → Done. Sprint 1 focused on the core cloud billing and cost monitoring functionality, while Sprint 2 continued with cost comparison, reporting, resource savings, storage monitoring, and budget management features. The Jira board made it easy to track completed work, work in progress, and remaining tasks.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart helped show the amount of story-point work remaining during the sprint and provided a comparison with the ideal progress line. As User Stories were completed, the remaining workload decreased from the initial sprint workload. Since this was a single-person simulated sprint rather than a real team sprint, the chart was mainly useful for understanding how much work could be planned and completed within the available sprint duration and for observing the team's simulated progress.
